

PantaScope

Panta has the rails. PantaScope adds the intelligence layer.

4

Connected views from discovery through safe execution planning

10

Typed API operations across data, quotes, builds, and claims

0

Private keys loaded, transactions signed, or trades broadcast

One terminal connects discovery, conviction, portfolio context, and execution planning.

01

Screener

Rank the market catalog by volume, phase, category, and implied probability.

02

Deep dive

Read spot prices, tape imbalance, whale activity, and resolution timing.

03

Portfolio

Price any wallet's positions against current market spot data.

04

Paper-trade lab

Run Panta's quote and build path, then stop before signing.

The screener finds signal before the trader opens a market.

1

Scan the full catalog

Phase and category filters narrow the opportunity set.

GET /markets/

2

Rank what matters

Volume and implied YES probability surface active markets.

Sortable, paginated market data

3

Open the strongest signal

One click carries the market into the analytical deep dive.

GET /markets/{id}/

The deep dive turns a trade tape into a conviction check.

Spot context

Primary and secondary prices make the market state legible.

Tape analytics

YES and NO volume, taker imbalance, and the largest trade reveal pressure.

Resolution timing

A live countdown keeps time risk in the decision.

One wallet address becomes a live risk view.

Wallet positions

Shares, side, market phase, and claim eligibility.

Market spot

Current YES or NO price from market detail.

- **Mark to market** prices each position using live spot data.
- **Claim readiness** surfaces resolved positions that can move into the claim-build flow.
- **Read-only by default** lets any public wallet be analyzed without a connection.

The lab proves the write path without taking custody.

Quote

Request expected shares, average price, fee, and expiry.

Build

Inspect Panta's unsigned instructions, accounts, and program data.

Wallet

The user remains the only party that can sign and broadcast.

The same pattern covers primary buys and market creation.

The typed client covers discovery through unsigned execution.

Read surface

- Market catalog
- Market detail
- Public trade tape
- Category allowlist
- Wallet positions

Planning surface

- Primary buy quote
- Primary buy build
- Market-create quote
- Market-create build
- Win-claim build

Built to survive scrutiny

Server-side key

The browser never receives the Panda credential.

Explicit failures

Timeouts and typed API errors fail loudly.

Submission gate

Typecheck, production build, contract tests, dependency audit, and a no-signing scan.

**See every market.
Understand every position.
Plan every trade.**

PantaScope makes Panta's API useful at the moment a trader decides.
